Management of Hepatitis C in Dialysis

**Hepatitis C and Dialysis**
- Higher prevalence than in the general and non-dialysis CKD populations
- Associated with higher risk of death, hospitalization, and worse quality-of-life scores among hemodialysis patients

**Symptoms**
- The majority of people with HCV infection are asymptomatic. In advanced stages, HCV may cause abdominal pain, gastrointestinal bleeding, bloating, nausea, fatigue, fever, loss of appetite, weight loss, or jaundice.
- Because HCV is asymptomatic in most cases, detection usually requires screening patients with risk factors and confirming viremia with HCV RNA testing in seropositive patients.

**Prevention**

Important parts of a successful prevention program include:
- HCV surveillance through periodic testing of alanine aminotransferase (ALT) and Hepatitis C viral (HCV) enzyme immunoassay (EIA) or HCV RNA
- Engaging hemodialysis personnel into preventing transmission of blood-borne pathogens. Activities to help reduce the risk of infection include:
  - Preparing single-use medications for patients in a clean area separate from dialysis stations
  - Avoidance of using common medication carts to deliver medications to patients
  - Cleaning and disinfecting stations between patients, and appropriate use of hand hygiene before and after patient contact

**Interpretation of Results of Tests for HCV Infection and Further Actions**

<table>
<thead>
<tr>
<th>Test Outcome</th>
<th>Interpretation</th>
<th>Further Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCV antibody nonreactive</td>
<td>No HCV antibody detected</td>
<td>Sample can be reported as nonreactive for HCV antibody. No further action required. If recent exposure in person tested is suspected, test for HCV RNA.*</td>
</tr>
<tr>
<td>HCV antibody reactive</td>
<td>Presumptive HCV infection</td>
<td>A repeatedly reactive result is consistent with current HCV infection, or past HCV infection that has resolved, or biologic false positivity for HCV antibody. Test for HCV RNA to identify current infection.</td>
</tr>
<tr>
<td>HCV antibody reactive, HCV RNA detected</td>
<td>Current HCV infection</td>
<td>Provide person tested with appropriate counseling and link person tested to care and treatment.†</td>
</tr>
<tr>
<td>HCV RNA detected, HCV RNA not detected</td>
<td>No current HCV infection, past infection that has cleared</td>
<td>No further action required in most cases. If distinction between true positivity and biologic false positivity for HCV antibody is desired, and if sample is repeatedly reactive in the initial test, test with another HCV antibody assay. In certain situations,§ follow up with HCV RNA testing and appropriate counseling. Future screening for HCV infection should be with HCV RNA testing, since the HCV antibody will remain positive for life.</td>
</tr>
</tbody>
</table>

* If HCV RNA testing is not feasible and person tested is not immuno-compromised, do follow-up testing for HCV antibody to demonstrate seroconversion. If the person tested is immunocompromised, consider testing for HCV RNA to detect infection.
† It is recommended before initiating antiviral therapy to retest for HCV RNA in a subsequent blood sample to confirm HCV RNA positivity.
§ If the person tested is suspected of having HCV exposure within the past 6 months, or has clinical evidence of HCV disease, or if there is concern regarding the handling or storage of the test specimen.
HCV Treatment Goal
Sustained virologic response (SVR), defined as undetectable HCV RNA 12 weeks after finishing antiviral treatment.

Direct Acting Antivirals (DAAs)
DAAs have been the focus of clinical research in recent years for their improved efficacy (90-100% SVR in most cases) and better tolerability compared to interferon-based therapy. Recent clinical trial studies have supported the safe and effective use of DAAs in HCV-infected patients receiving hemodialysis. Typically, multiple DAA classes are used in combination (NS5A or NS5B inhibitor with a protease inhibitor) to target different aspects of the HCV genome.

### Multi-Class Combination Direct Acting Antivirals

<table>
<thead>
